

DRAINTEX™

GEO FABRIC THAT WORKS

A standard duty, non-woven geotextile fabric with excellent drainage and filtration properties. DRAINTEX has a stable but open structure making it ideal for lining trenches when constructing land (French) drains.

DRAINTEX is also used for wrapping soakaway and water attenuation crates in both small domestic and large commercial projects. The high permeability of the fabric means water can percolate through whilst preventing the soakaway becoming 'silted' up. DRAINTEX can be used as a ground stabilisation membrane beneath MOT Type 1 or 3 aggregate or hardcore to form a stable base in many hard landscaping and civil engineering applications.

INSTALLATION GUIDELINES

(for use as a drainage membrane)

1. Excavate a trench to receive the land drain, to a suitable depth and width.
2. Line the base and sides of the trench with DRAINTEX fabric, cutting it to a suitable length and width where required. Overlaps should be kept to a minimum, but where necessary they should be a minimum of 300mm. Leave enough DRAINTEX fabric protruding beyond the top of the trench on both sides to cover (with an overlap) the shingle/gravel before backfilling the top of the trench.
3. Lay a bed of 10mm pea shingle (or similar clean, non-limestone gravel) in the base of the trench on top of the DRAINTEX fabric.
4. Lay the perforated pipe on top of the shingle and fill round with more shingle/gravel, making sure there is at least 75mm surrounding the pipe.
5. Cover the top of the shingle/gravel with the remaining DRAINTEX fabric (see point 2).
6. Backfill the rest of the trench with soil before installing the surface finish e.g. turf.

INSTALLATION GUIDELINES

(for use as a ground stabilisation membrane)

1. Excavate soil (sub-grade) to the required depth (allowing for sufficient depth of sub-base, base course layer and the surface finish e.g. block pavements, tarmac etc, including any base layer required for these – depths of each layer will vary depending on the intended use e.g. pedestrian/vehicle use, light/heavy use).
2. Lay DRAINTEX fabric out and ensure joints are overlapped by a minimum of 300mm (overlaps should be kept to a minimum). For some applications the specification may require DRAINTEX to be jointed using other methods, e.g. stitching, gluing etc.
3. Secure using EXTRAFIX fixing pegs.
4. Lay sub-base layer over the fabric and compact using a compacting plate or roller.
5. Following installation of the sub-base, base layers (e.g. base coat tarmac) for the surface finish can be laid.

PRODUCT SIZES

CODE	PRODUCT	WIDTH	LENGTH	AREA
DRA10	Mini Roll Narrow width, ideal for paths	1.0m	10m	10m ²
DRA25	Midi Rolls For medium size projects	2.0m	25m	50m ²
DRA225		2.0m	50m	100m ²
DRA45	Contractor Pack - Wide width, ideal for patios & driveways	4.5m	11.1m	50m ²
DRA450	Contractor Roll	4.5m	100m	450m ²
