## TCS GABIONS

Our gabions are manufactured from steel wire, resistance welded at intersections to form a dimensionally stable bi-axial mesh panel.

TCS Gabions are factory assembled with galvanised steel clips connecting the panels, and where necessary an internal diaphragm to the base panel, offering additional support. Our gabions are supplied flat packed for onsite assembly and come complete with tying wire.

## WIRE

Wire is galvanised to ASTM B750 standard specification for Galfan (95% zinc and 5% Al).

Nominal wire thickness is typically 3.0mm diameter with 4.0mm and 5.0mm also available.

## MESH PANEL

Mesh openings are square with a nominal dimension of 76.2 x 76.2mm as standard, other mesh opening sizes are available to special order.

## ANCILLARIES

To aid in the installation process and lower installation times a range of ancillary items are available.

Helicals (not supplied as standard) can be used for vertical joints and supplied in a nominal 3.0mm wire diameter.

Preformed corner bracing ties (not supplied as standard) are also available in a nominal 3.0mm wire diameter.
